JOB DESCRIPTION

This template is for use in an ASET C.Tech. or C.E.T. application; a sample job description is located on the next page.

Employer's Name:	Dale (HK) Limited	Duration of Employment:	Mar 1, 2004–April 30, 2019 (Full Time)
Position/Title:	Director and Engineering & Product Development Manufacturing Lead		

Duties and Responsibilities: (Be descriptive of your duties and responsibilities for this position; they should reflect the activities listed under the [technician \(C.Tech.\)](#) or [technologist \(C.E.T.\)](#) as well, this job description supports the content within the competency summary.)

As Director and Engineering & Product Development Manufacturing Lead, Mr. Tai was responsible for overseeing end-to-end engineering, product development, supply chain, and manufacturing activities within an OEM/ODM consumer-electronics environment. His role required applying engineering principles to electronic product design, cost optimization, supplier management, production validation, and quality assurance across multiple global retail client projects.

1. Engineering & Product Development

- Led engineering design coordination for OEM/ODM consumer-electronics products (audio/video products).
- Reviewed and validated electronic PCB designs, BOM structures, specifications, and prototype samples with engineering teams and chipset suppliers (e.g., Philips, Zoran, MediaTek).
- Conducted technical feasibility analysis for new product concepts, ensuring compliance with functional, regulatory, and manufacturing requirements.
- Oversaw reviews to improve manufacturability, assembly flow, and defect prevention.

2. Technical Project Management

- Directed the full project lifecycle from product concept, engineering development, tooling fabrication, prototyping, and pilot production through to mass-production release.
- Managed engineering schedules, risk assessments, design-change and change-control processes, and all associated technical documentation, including BOMs, ECNs, test reports, regulatory compliance files, and production-readiness documentation.
- Coordinated cross-functional engineering work with external software development teams (firmware partners iWedia and Hyperpanel), EMS manufacturing partners, quality-assurance teams, and international retail partners to ensure alignment on specifications, technical requirements, and project deliverables.

3. Supplier & Manufacturing Engineering

- Evaluated and selected manufacturing partners; reviewed production capabilities, process controls, and engineering support capability.
- Conducted on-site engineering reviews, production line assessments, yield-analysis meetings, and corrective-action planning.
- Solved engineering and production issues related to IC/chipset integration, PCB design, firmware behavior, mechanical fit, and reliability performance.

4. Cost Optimization & Technical Procurement

- Negotiated chipset and component supply agreements (e.g., Philips/NXP), optimizing rebate programs, unit cost structures, and long-term supply-chain stability.

- Performed cost-down engineering analyses to reduce BOM costs, tooling expenses, and manufacturing process inefficiencies through design optimization, component substitution, and production workflow streamlining.
- Improved chipset delivery lead-times from 60+ days to approximately 30 days through rebate-driven procurement strategies, supply-chain technical planning, and production process re-engineering.

5. Quality Assurance & Compliance

- Reviewed and validated product specifications, safety standards, and regulatory requirements for international markets, including CE, FCC/EMC, RoHS.
- Led comprehensive technical evaluations of product samples, reliability test reports, failure-analysis findings, and corrective-action documentation to ensure products met functional, durability, quality-inspection, and performance standards.
- Conducted engineering assessments to verify compliance with international regulatory expectations and global retailer requirements.
- Ensured final products met required performance criteria, durability benchmarks, and retailer-specific compliance obligations.
- Supported Walmart Environmental, Health & Safety (EHS) and other global retailer audits by coordinating corrective actions with factories, validating technical documentation, and ensuring production processes adhered to corporate, regulatory, and quality-assurance standards.

6. Cross-Functional & Client Technical Coordination

- Collaborated directly with international retail clients (including Carrefour, Tesco, Asda, and Bang & Olufsen) to define technical specifications, resolve performance issues, and manage product development milestones.
- Prepared engineering documentation, product briefs, sample evaluation reports, and technical presentations to support client approvals and product readiness.
- Coordinated with cross-functional engineering teams—including electronics, mechanical, firmware, testing, and QA—to ensure technical requirements, design intent, and project deliverables were aligned across all disciplines.

Key Achievements

- Delivered one of the best-selling and smallest DVB-T / set-top box product lines for major global retailers, including Carrefour, Asda, Bang & Olufsen, and other international brands.
- Negotiated a 100K-unit chipset rebate and supply program with client HF Group and the chipset manufacturer/distributor, reducing chipset delivery lead-time from 60+ days to approximately 30 days through repeat purchase-order alignment, fulfillment of first IC-masking requirements, and improved supply-chain responsiveness.
- Successfully led continuous OEM/ODM product development for multiple global brands, overseeing end-to-end engineering, product development, and manufacturing activities across concept design, prototyping, tooling, pilot production, and mass production.
